

Day 03

I have uninstalled the git, android studio, deleted flutter sdk.

I have reinstalled everything again.

Set the android studio.

I created a flutter project.

Topics related to Flutter:

Widget: Is each element we see in the interface.

Everything in flutter is a widget.

Widgets can be passed as arguments.

The widget passed in the **runApp** widget, is named as root widget.

widget Tree: Is a bunch of widgets, used to build the widget tree.

Widget are just like **components** in **react js**, we create different components, and then bundle them together to form the main component/page.

There are StatelessWidget, as well as StatefulWidget.

We have widget for literally everything, from texts, images, button, containers, etc...

StatelessWidget: Are the widgets that won't contain data that changes dynamically.
