

Day04

MaterialAPP and Scaffold

These are the widgets used to wrap the app contents.

When building flutter app, we can use the customized or pre-built widget.

MaterialApp: Is a pre-built widget that allows us to use google material design style, including its components (button, texts styles...)

It is customizable, so we can make the app layout unique.

When using MaterialApp, the texts need to be placed within material ancestor widget (Scaffold), so the builtin style can be applied.

Scaffold: is the widget that allows us to built the body of our app.

In this lesson, I created a very simple app bar, and a very simple app body with a simple text.
